TITLE: On the problem of selecting the dimensions for the beam cross section in various electron-beam devices ⁶⁴₅

SOURCE: Ref. zh. Elektronika i yeye primeneniye, Abs. 11A212

REF SOURCE: Tr. Nauchno-tekhn. konferentsii Leningr. elektrotekhn. in-ta svyazi, vyp. 2, 1964, 116-123

TOPIC TAGS: electron beam, beam modulation, capacitor

ABSTRACT: The principle of current modulation by beam deflection is discussed. A circuit is described which consists of two flat capacitors lying in a single plane and separated by a narrow gap. The modulation characteristics of this type of system depend on the transverse dimensions of the beam and on the ratios of the capacitor voltages. Exact and approximate equations are derived for the modulation characteristics and data are given which may be used to evaluate the error of the approximate formulas. A system consisting of three flat capacitors is also considered. N. O. [Translation of abstract]

Title : Germination of Cotton Plant Seeds in Relation to the Period of Planting.

Orig Pub : Izv. AN UzSSR, Ser. Biol. ..., 1957, No 3, 31-37

Abstract : In the field tests of the Central Selection Station of SoyuzNIKHI (Tashkent) in 1953-1955, two periods of cotton planting were studied: early (the end of March) and a relatively late one (middle of April). It was determined that in favorable years, the seeds germinate intensively with late planting and by the 20-25 of April surpass in the number and the growth of the sprouts the plantings of the early period. In unfavorable years, a

substantial difference is detected in the condition of the sprouts of the plantings of different periods. With a sufficient soil moisture content, lower temperatures lead to the start of decay as the result of disturbed metabolism and the exhausting of the reserve of the nutrient substances in the seed. In this, seeds which sprouted earlier and have sizable sprout, that is the most mature and the most productive ones, begin to rot first; and seconds (plants from not fully mature, slowly germinating seeds) remain, producing less viable, poorly productive offspring. Under these conditions, the advantage is with the late planting the seeds of which begin to germinate later. However, in case of a droughty spring, the advantage is on the side of early planting, the seeds of which produce earlier sprouts which have time to penetrate into the moist layer of the soil. The cotton planting period should be determined more

TITLE: The convergence of Post's combination problem for certain mass problems in the theory of finite automata

CITED SOURCE: Sb. Vychisl. i. sistemy. Vyp. 8, Novosibirsk. 1963, 71-73

TOPIC TAGS: finite automaton, alpha automaton, beta automaton, automaton joinability, combinability of random systems

TRANSLATION: The so called α -automatons are discussed, i.e. finite automata which have one input channel x and 2 output channels z_1 and z_2 . At every moment t the α -automatons will print the letter $z_1(t)$, if $z_2(t) = 1$, or will print nothing if $z_2(t) \neq 1$. The paper also deals with β -automatons which have one input and one output channel. At every moment i , under the influence of input of the letter $x(i)$,

Card 1/2

L 24147-65

ACCESSION NR: AR5000991

the automaton will print some finite word which is a function of $x(i)$ or of the current state of the automaton. Two random α -automatons (or β -automatons) A and B are called combinable if there exists some finite input word which, used as input in the automatons A and B, will cause the same output of meaningful words. The problem of recognizing the combinability of a pair of α -automatons (or β -automatons) also extends to the problem of recognizing the combinability of random systems of word pairs in the given alphabet. A. A. Markov has shown that the latter problem is algorithmically insoluble if the alphabet contains more than 2 letters. V. Marty*nyuk

TITLE: Algorithmic unsolvability of problems of determining completeness for
finite automata.

SOURCE: AN SSSR. Doklady*, v. 155, no. 1, 1964, 35-37

TOPIC TAGS: decision problem, completeness problem, finite automaton, al-
gorithmic unsolvability, od operator, computer log, symbolic logic, finite al-
phabet, initial basis, logical net, switching circuit, initial basis, cybernetics

ABSTRACT: Considering "logical nets over a basis consisting of delay circuits
and logical circuits," the author makes the following assumptions: first, the
components may be arbitrary finite automata, not necessarily logic circuits or
delay circuits; second, each input and output channel of a component may take
states in some finite alphabet not necessarily the alphabet {0,1}; third, either
of the following two assumptions can be made about the bases under discussion:
(1) the basis elements are initial automata and an initial state of a logical net over

Card 1/3

L 21071-65

ACCESSION NR: AP4022948

a basis is the state appearing when all of its elements are in their initial states (initial basis); (2) the basis elements are not initial automata; and the logical net may contain automata whose initial state is any internal state (noninitial basis). If there exists a logical net over an initial (noninitial) basis \mathcal{B} in which an operator T can be realized, we say that T is realizable in the initial (noninitial) basis \mathcal{B} . An initial (noninitial) basis is said to be complete if it can realize any od operator. Moreover, with any od operator T it is possible to associate the following decision problem, which is called the realization-decision problem for the operator T : Find an algorithm that will make it possible to establish whether a given initial basis \mathcal{B} admits realization of any od operator T . The author proves the following theorems: Theorem 1: The realization-decision problem for an arbitrary od operator T in initial (noninitial) basis is algorithmically unsolvable. Theorem 2: The problem of deciding whether an initial (noninitial) basis is complete is algorithmically unsolvable. Theorem 3: For arbitrary initial (noninitial) bases \mathcal{B}_1 and \mathcal{B}_2 , the following problems are algorithmically unsolvable:

Card 2/3

L 21071-65

1601. KRATKOVA E. Obvodn. nemocn., Praha-Krč. • Terramycin v léčbě pneumonii. Oxytetracycline in the treatment of pneumonia
PEDIAT. LISTY 1954, 9/4 (214)

Experiences of treatment in 20 cases are described. Ten were due to *M. pyogenes*, 2 to pneumococcus and 8 had negative bacteriological findings. The cases of *M. pyogenes pneumoniae* were those most resistant to penicillin. Oxytetracycline was given orally in a dosage of about 50 mg./kg. daily. The daily amount was given in

1601

CONT.

4 divided doses at intervals of 6 hr. If the child does not react the dose is increased by 50% and given rectally. This treatment was followed by an improvement after 48 hr. After the fall of the temperature the dose was diminished by a half. The drug was given for a period of 9 days, in 2 cases of empyema for 20 days. The combination penicillin-oxytetracycline cannot be recommended on account of their mutual antagonism. Streptomycin may be the most appropriate among the other antibiotics. There were no serious complications after the administration of oxytetracycline. All children had a thin greenish stool, vomiting was frequent, but these complications were never serious enough to require an interruption of the treatment. One serious case of alar pneumonia died after 3 days, but heavy toxicosis developed from the spread of endotoxins liberated into the organism. One child died, the others were satisfactorily cured. Indications for treatment with oxytetracycline are mainly *M. pyogenes* and virus pneumonias. The effect is more rapid the sooner treatment with appropriate doses of the antibiotic is started.

Onkol. 1956, 3/2 (128-136) Illus. 9

A description is given of a case of mixed hepato-cholangiocellular carcinoma superimposed on hepatic cirrhosis in a boy aged 8 yr. occurring after recurrent epidemic hepatitis. The authors consider the various morphogenetic stages of the development of the initial hepatodystrophic process to liver cirrhosis and of the degeneration of the latter to carcinoma. This case is the first in a child to be described in the international literature.

The importance of correct treatment of pharyngitis for the prevention of sterile complications ČAS. LÉK. ČES. 1957, 96/5 (137-140) Tables 2
 Timely and correct treatment with penicillin is useful in preventing the development of acute glomerular nephritis, rheumatic fever and myocardial injury after streptococcal pharyngitis. In 114 children treated with penicillin (oral penicillin, pendepon, DBED-penicillin in mixtures or injectable preparations) there was not one observable case of glomerular nephritis, rheumatic polyarthrititis or endocarditis within 3 to 6 weeks. Five cases showed ECG changes, of which 4 developed after pharyngitis in which β -haemolytic streptococcus was found, but these ran their course without subjective complaints from the affected children. Only in one case were there ECG changes of sufficient degree to enable a diagnosis, according to modern criteria, of an injured myocardium of a rheumatic type.

"Dynamics of Laboratory Tests in Children Suffering from Rheumatic Fever."

Prague, Casopis Lekarů Ceskych, Vol 105, No 22, 3 Jun 66, pp 585 - 591

Abstract [Authors' English summary modified]: Laboratory findings in 86 children suffering from rheumatic fever were investigated dynamically for a period of 11 weeks. MPT, total protein, albumin, alpha₁, alpha₂, beta, and gamma-globulins, and sedimentation rate were determined once a week, ASLO titres once every three weeks. Average sedimentation rates declined from the original value of 74 to 23 at the end of the period. Average MPT values declined from 6.6 mg% to 4 mg%, ASLO titres from 542 to 258 units. Total protein, alpha₁ and beta fractions did not change, average albumin values rose from 47 to 54%. Average alpha₂ values declined from 12.5 to 11%, gamma globulin 21.7 to 16.5%. 1 Figure, 13 Tables, 2 Western 1/1 5 Czech, 1 Hungarian reference. (Ms. rec. Jun 65).

Title : Antabuse and Levels of Volatile Substances in the Blood

Orig Pub : Casop. lekaru ceskych, 1957, 96, No 4, 123-127

Abstract : The effect of antabuse (:) upon fluctuations of the level of the volatile substances in the blood was studied on 12 patients suffering from alcoholism. Determination was effected by Widmark's method. It was found that under the influence of A without administration of alcohol, the level of volatile substances in the blood increases up to 0.13-0.35 percent. Following the administration of small amounts of alcohol, A was increasing the level of volatile substances in the blood to a greater degree than the same doses of alcohol without A. -- I.A. Frolova

TITLE: Construction of bridges and culverts for the wide-gage Matovce-Haniska
railroad line

SOURCE: Inženýrské stavby, no. 10, 1965, 425-440

TOPIC TAGS: railroad, railway construction, railway bridge

ABSTRACT: A new, 90-km long, wide gage railroad between Matovce, Trebisov and Haniska in Eastern Slovakia has been under construction since 1963 with a construction deadline of 1 May 1966. The State Institute for Transportation Projects (SUDOP) and Soviet experts designed and drew up the construction work. The present paper deals in detail with the problems of the project, the production of prefabricated components and their installation. It includes an outline of contemporary Soviet construction methods of railroad bridges, with technical details on culverts, load-bearing and substructures of bridges, manufacturing methods, transportation and installation of bridges in various terrains, and economic considerations. Graphic material shows detailed cross sections and photographs of several bridges; one of the tables presents data on load-bearing structures of Soviet railroad bridges. Orig. art. has: 20 figures, and 6 tables. [KS]

pp. 92-101, 10 figs)

The advantages and shortcomings of various methods of mass production, leveling and haulage at steeply inclined seams of Hungarian Lassic coal mines are described. The distances between main gate haulage levels are determined. Working levels are established between main gate haulage levels, and the won coal is delivered through spiral chutes to the main gate haulage levels. Gate road maintenance should be carried out with a view to lasting over a long period of time when haulage will be effected in large trucks drawn by heavy locomotives. The use of belt conveyors between workings and spiral chutes is recommended.

AUTHOR: Kratky, V. (Czechoslovakia)

6-58-6-14/21

TITLE: Systematic Errors in the Evaluation of Aerial Photographs in Stereometers (Sistematicheskiye oshibki obrabotki aerosnimkov na stereometrach)

PERIODICAL: Geodeziya i kartografiya, 1958, Nr 6, pp. 58 - 70 (USSR)

ABSTRACT: The systematic errors dependent on the approximation of the simplified correction formula are found and the maximum values for the coordination of the external orientation of tilted aerial photographs as well as the relief elevations on stereoscopic photographs, where these errors can still be neglected, are determined. First the relation between the coordinates of the map and those of the horizontal aerial photograph is investigated. The formula for the correction of the abscissa in the map (4) and the formula for the correction of the displacement (10) are derived. In the second chapter the residual systematic errors are investigated according to the orientation of the stereometer. In consequence of the difference between the formulae (8) and (10) (in the latter the terms dependent on y^2 and xy^2 are missing) the corrections for the displacement will not

Card 1/2

Systematic Errors in the Evaluation of Aerial Photographs in Stereometers

6-58-6-14/21

correspond to the theoretically correct corrections. The discrepancies change according to the position of individual points; it is artificially removed at ground control points. The orientation of the aerial photographs of a flat and of a mountainous area are investigated. For the latter the use of the stereometer STD -1 and of the stereometer STD 2 is dealt with.- The author does not investigate the average errors but the maximum values of the errors corresponding to the least favorable conditions. There are 4 tables and 3 references, all of which are Soviet.
